1. Introduction

The purpose of this test plan is to outline the testing approach, scope, and objectives for E-commerce website. The site allows users to browse products, add them to a cart, and complete purchases online. Testing will ensure functionality, performance, accessibility and security meet business requirements.

2. In Scope

2.1 Functional Testing

- a. Sign-up including email verification flow
- b. Login / logout, session persistence, auth storage state reuse
- c. Navigation flow (menus, links, breadcrumbs)
- d. Product listing page — browsing
- e. Product detail page — name/price consistency with listing page
- f. Cart operations — add item, update quantity, remove item, cart badge/count updates
- g. Cart totals calculation
- h. Checkout flow — contact info, shipping address, payment info entry
- i. Form field validation — required fields, invalid formats, empty submissions, error messages
- j. Error/success message clarity and placement
- k. Order confirmation flow (guest checkout and logged-in checkout)
- l. API testing — GET all products, response status codes, schema validation

2.2 Non-Functional Testing

- a. Cross-browser testing — Chrome, Edge, Firefox, Safari
- b. Responsive/mobile testing — layout and usability on mobile, tablet, and desktop viewports
- c. Layout consistency across pages — uniform spacing, consistent page structures
- d. Visual consistency of UI elements
- e. Basic performance testing — page load time, time-to-interactive for key pages (home, product, cart, checkout)
- f. Basic security sanity checks — input sanitization on forms, checking for exposed sensitive data in responses (non-intrusive checks only)

- g. Accessibility testing (basic) — keyboard navigation, alt text presence, color contrast, ARIA labels on key flows

3. Out of Scope

- a. Real payment gateway processing
- b. Full-scale performance testing
- c. Formal penetration testing / deep security audit (basic sanity checks only, as noted above)
- d. Backend infrastructure, server configuration, hosting, or database-level testing
- e. Admin panel or CMS backend
- f. Third-party service internals— only their role in supporting a test flow (like email verification) is in scope, not the service itself
- g. Localization testing
- h. Legacy testing
- i. Formal compliance audits

4. Objectives

- a. Validate the functional correctness of the e-commerce website through manual and automated testing.
- b. Identify and document defects in core user flows to ensure reliability and stability.
- c. Assess usability and overall quality of the site, focusing on user experience and accessibility.
- d. Validate the supporting API to confirm accurate data exchange and backend reliability.

5. Test Items

- 1. User account creation and login
- 2. Homepage navigation
- 3. Product catalog
- 4. Product detail pages
- 5. Cart functionality (add items, update quantity, remove items)
- 6. Checkout flow (address, payment, confirmation)

7. Order status tracking

6. Test Approach

- a. **Manual Testing:** Functional, regression, exploratory.
- b. **Automation:** Playwright scripts for smoke tests (login, cart, checkout, order status).
- c. **API Testing:** Postman collections for product and order endpoints.

7. Test Environment

- a. **Browsers:** Chrome, Edge, Firefox, Safari (latest versions).
- b. **Devices:** Desktop (Windows 10), Mobile (Android, iOS).
- c. **Screen Resolutions:** 1920×1080 (desktop), 768×1024 (tablet), 375×812 (mobile)
- d. **Test Data:** Test user accounts, test credit card numbers, dummy addresses (Test accounts created via automation)

8. Tools

- a. Playwright + TypeScript for automation
- b. Postman API testing for backend checks
- c. Manual testing via Chrome DevTools for responsive checks

9. Entry & Exit Criteria

9.1 Entry Criteria:

- 1. Requirements finalized
- 2. Site is accessible and stable
- 3. Test environment ready
- 4. Test cases and manual test scripts are written and reviewed

9.2 Exit Criteria:

- 1. All planned test cases and scripts are executed
- 2. Critical defects resolved and documented
- 3. Test summary report completed

10. Deliverables

- a. Test cases
- b. Manual test scripts
- c. Automated test scripts
- d. Bug reports
- e. API test report
- f. Test summary report

11. Roles & Responsibilities

- a. **QA Analyst:** Design and execute test cases and scripts, log defects
- b. **QA Lead:** Review artifacts, track progress
- c. **Developers:** Fix defects, support testing

12. Schedule

- a. **Week 1:** Test planning and environment setup
- b. **Week 2–3:** Functional and regression testing
- c. **Week 4-5:** API and automation testing
- d. **Week 6:** Test summary report and closure

13. Risks & Mitigation

- a. **Risk:** Sandbox limitations in payment testing
Mitigation: Use multiple dummy card scenarios (valid, invalid, expired, insufficient funds). Validate error handling and messaging in checkout flow. Document clearly that real gateway behavior is untested.
- b. **Risk:** Unstable builds
Mitigation: Daily smoke testing.
- c. **Risk:** Environment/browser incompatibility
Mitigation: Test across latest versions of Chrome, Edge, Firefox, Safari, and common mobile devices. Log and prioritize cross-browser issues.
